

Advancement in modern technology

Moving towards the 21st century, technological advancement has become a focus of today's society. Technology has entered the lives of even the poorest members of our society, and it is very rare to find anyone who does not have some form of modern technology, such as a TV or a food processor, in their home.

There are many things to be said in favour of technological advancement, the most obvious being that it undoubtedly makes people's lives easier. Without benefits that technology brings, the world would be a much harder place to live in. For example, how would any business operate without faxes, photocopies or telephones?

On the other hand, technology also has the potential to destroy everything at the touch of a button - a point eloquently made by Quentin Reynolds when he said, "The scientists split the atom; now the atom is splitting us". The danger of technological advancement is that machines will completely replace humans, leaving fewer jobs and reducing human contact in everyday life, which cannot be a good thing for society.

Although technology has the potential to provide a better quality of life for everyone, it is also capable of destroying everything within a very short space of time. As such it should be developed with caution and should never be allowed to take place of human contact, because this is what ultimately holds a society together.

Humans need a challenge and advancement and forward progression of the species. After all; why does someone climb a mountain? It is there and it is a challenge. Using technology to help mankind along in his journey to create better, strong and better civilizations is wise.

If you're a person of present tense, you would certainly agree that the world is becoming more advanced with each passing day. In a blink of an eye, old typewriters have been replaced by modern laptops and computers, analogical and wired mobile phones have been replaced by sleek and smart designs of wireless and new generation phones, and even the way you communicate with your loved ones no longer needs the use of overseas calls, but the modern communication brought by electronic mails, chats, and webcams.

These days, the use of modern devices and machineries has even made the power of technology more influential. These advancements generate a lot of benefits to common people who have gradually become used to what modern technology brings - convenience, pleasure, knowledge and information.

To cite some of the best things that technology has brought into our lives so to speak, here are few of the many advancements and developments we've delightedly reaped so far:

- If you're searching for substantial information, the Internet is there to assist you of your every need. Although books are still the greatest source of knowledge, it is impressive to note that the internet provides a faster research through few clicks of the mouse.
- If you want to get in shape, but abhors the thought of major dieting and exercise, the modern advancement provided by laser treatments are indeed amazing inventions of both science and technology.

- If you want to simply enjoy life right at your fingertips, the coming out of wireless technologies , mp3 players, iPods, Bluetooth devices, spy devices, flash storage, and text and video messaging among others absolutely brings out a major influence and difference in your life weigh against the kind of lifestyle you lead decades back.
