

Comparison of two computers

The two computers I will be comparing are the Solo 1000 and the ProSentia 3000.

The ProSentia is slightly more expensive than the solo at £899 than the solo at £589.

The first computer, the solo, has an AMD Athlon 1000MHz processor but the ProSentia has a Pentium 4 processor 1.4 GHz that is faster than the solo. The processor is the brains of the computer and carries out the tasks, so a faster computer would suite policies 'R' us because all tasks can be carried out quicker.

The solo has a 40Gb hard drive compared to the ProSentia, which has a 20Gb hard drive, the size of the hard drive is important because this stores all of the programs and work files.

The solo would have more space on it than the ProSentia, this also has a 128 Mb RDRAM which is the same as the solo, the memory isn't as important because it is only used to run the programs, But Policies 'R' us will not need the memory to be to big because there programs wont be to complicated.

The ProSentia comes complete with software including Microsoft Office that contains Word, Excel, Access, Outlook and Publisher. This would save the company buying it separately. It also comes with Microsoft Windows 2000 Professional, an anti-virus program and other software tools. Where as the Solo comes complete with Windows Millennium Edition and Cyber link DVD playback CD creation and copy software (CD-Rw systems).

I advise Policies 'R' us to pick the ProSentia 3000 because it has certain things that would be useful to Policies 'R' us.

The ProSentia has a larger processor at 1.4GHz. This means that they can do things Quick so things are more efficient.

It does not have as much of a hard drive as the solo but Policies 'R' us will not need that much hard drive because they will not need to save that many programs only ones linked to work.

They both have the same amount of memory they so this does not matter any way.

The ProSentia is more money but it is definitely worth it.
