

Thomas Telford School Online Ltd**GNVQ Intermediate Information and Communication Technology 2001 Assignment 5 -
Unit 3**

We had to create a website that would tell people about different types of hardware and that we would be able to read, edit and understand the hypertext markup language (HTML) on our website.

In planning for this website I had to work out where I was going to get my images, backgrounds and animated gifs from. I had to be careful with what I chose as there are a lot of copyright laws that we must obey. The Websites that I decided to use for my animated text was www.cooltext.com this contained many different types of animated and internet text that I could download without breaching any copyright laws. For the backgrounds to my site I decided to use the search engine www.bbc.co.uk and use whatever sites they came up with. For my animated gifs I used a wide range of websites but the main two I used were www.animifactory.com and www.coolarchive.com these two sites allowed me to download animated images. After I had done this I had to plan what computers I was planning to add on to my Web-page and what web-sites I was going to use for this. The web-pages that I decided to use were www.imac.com, www.dell.com, www.epson.co.uk and www.dixons.co.uk. After I had done this I thought that I should know where to download the music for the backing to my web page for this I decided to use www.napster.com. The music that I decided to download for the background to my web-page was Eminem with Without Me. I then had to plan a basic layout of how I wanted my Web-page to look. This so that I would be able to tell where I was going to have my hyperlinks linking one page to another.

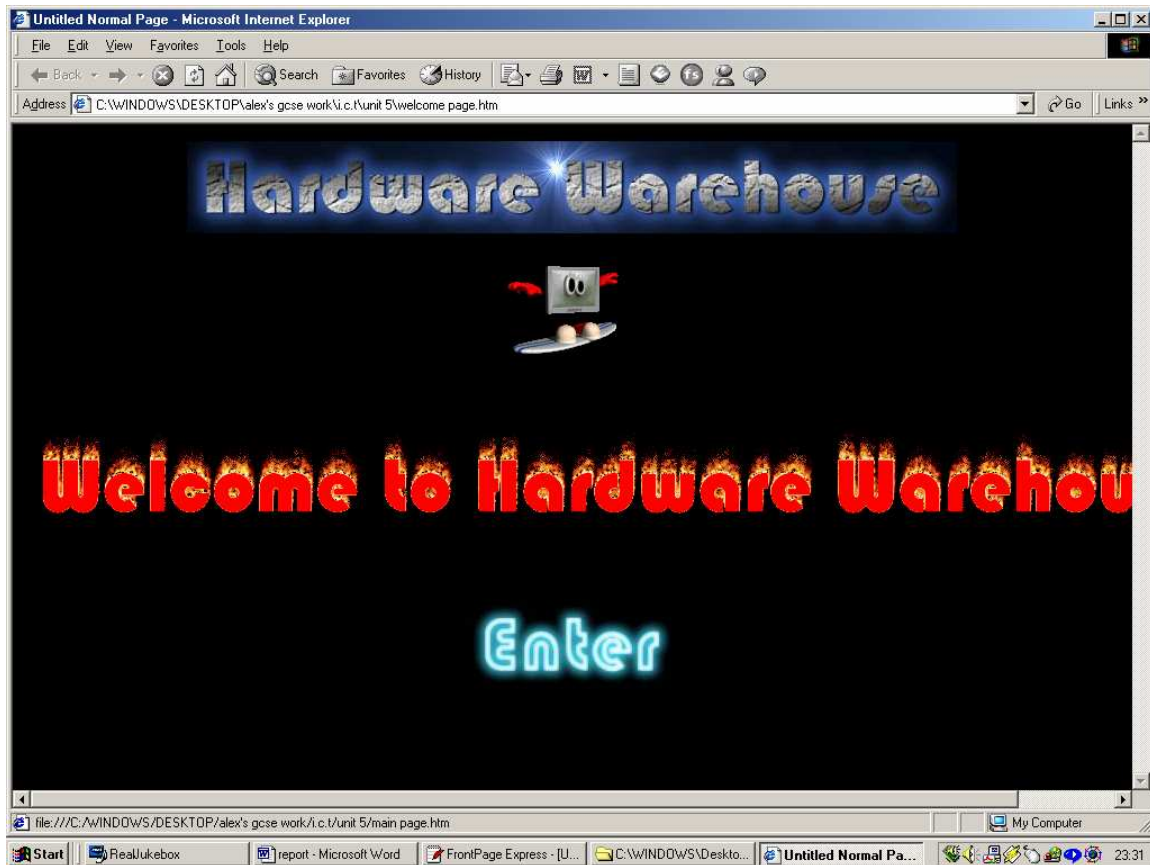

Our website had be easy to use. This meant that it could not be to technical for people who were using the website to buy there first computer. The users needs on this web-page is tooo purchase Hardware and computer packages. In order to cope with a different range of people I thought I should include a wide variety of different types of hardware. This PC packages, Laptops, scanners, Printers.

Our website had to contain a Welcome page and a main page which would provide 6 other links to various pages containing information about different types of hardware on them(packages, Laptops, moniters, scanners, printers and accessories). We also had to use animated graphics and internet text to make our website look attracting to the public.

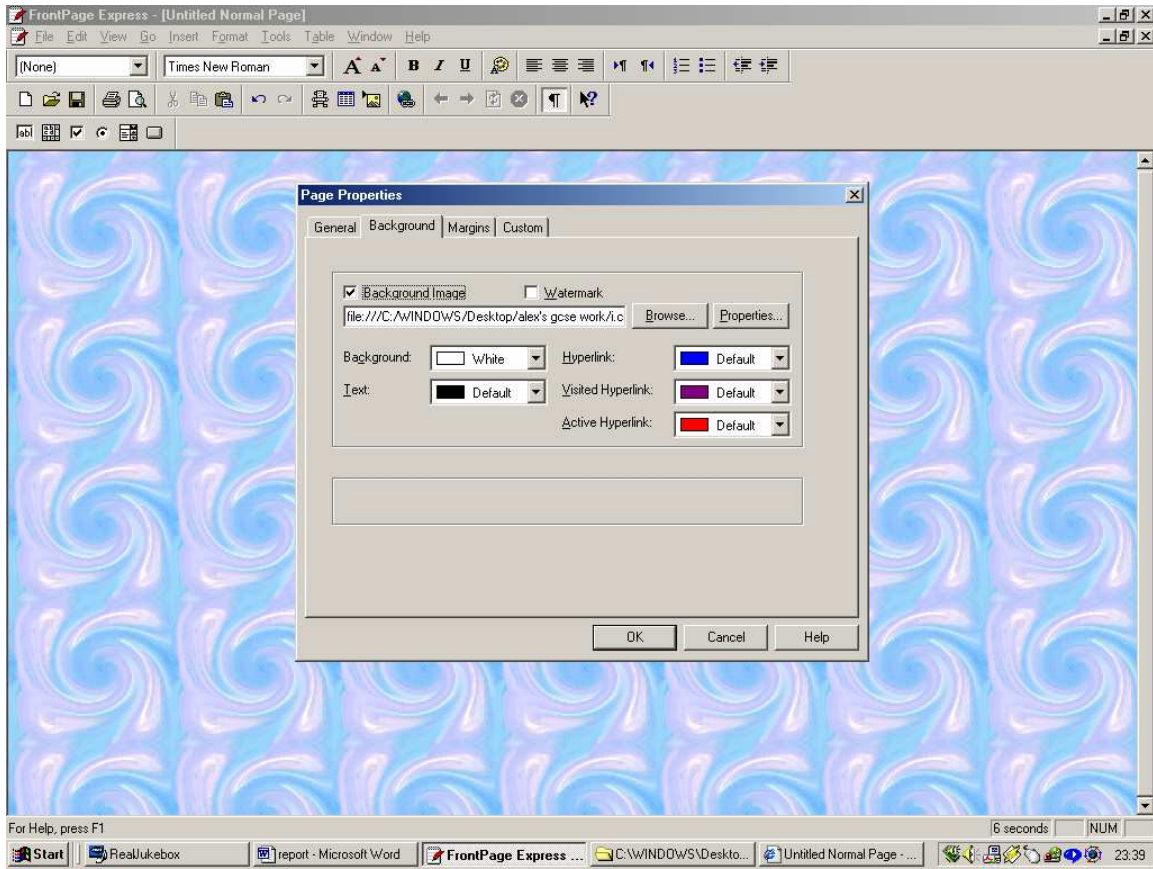

on my first page I haved used 2 animated images and two different types of internet text. This is so that the web page first impression is not to crowed and people will enjoy it. On this page I have also included one hyper link this links the welcome page to the main page so that customers will have a choice in

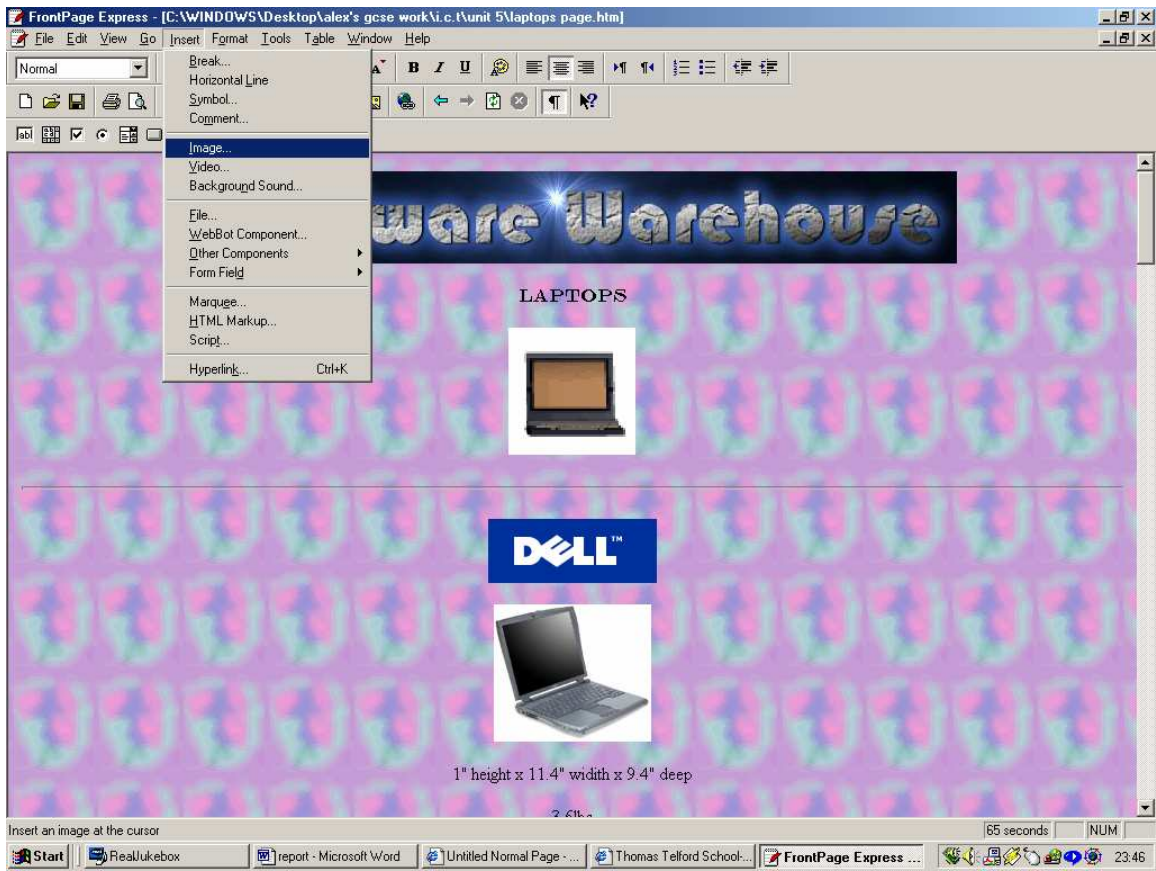

what they purchase. The hyper link on this page is the enter sign this will take the customer to the next page at the click of a mouse.

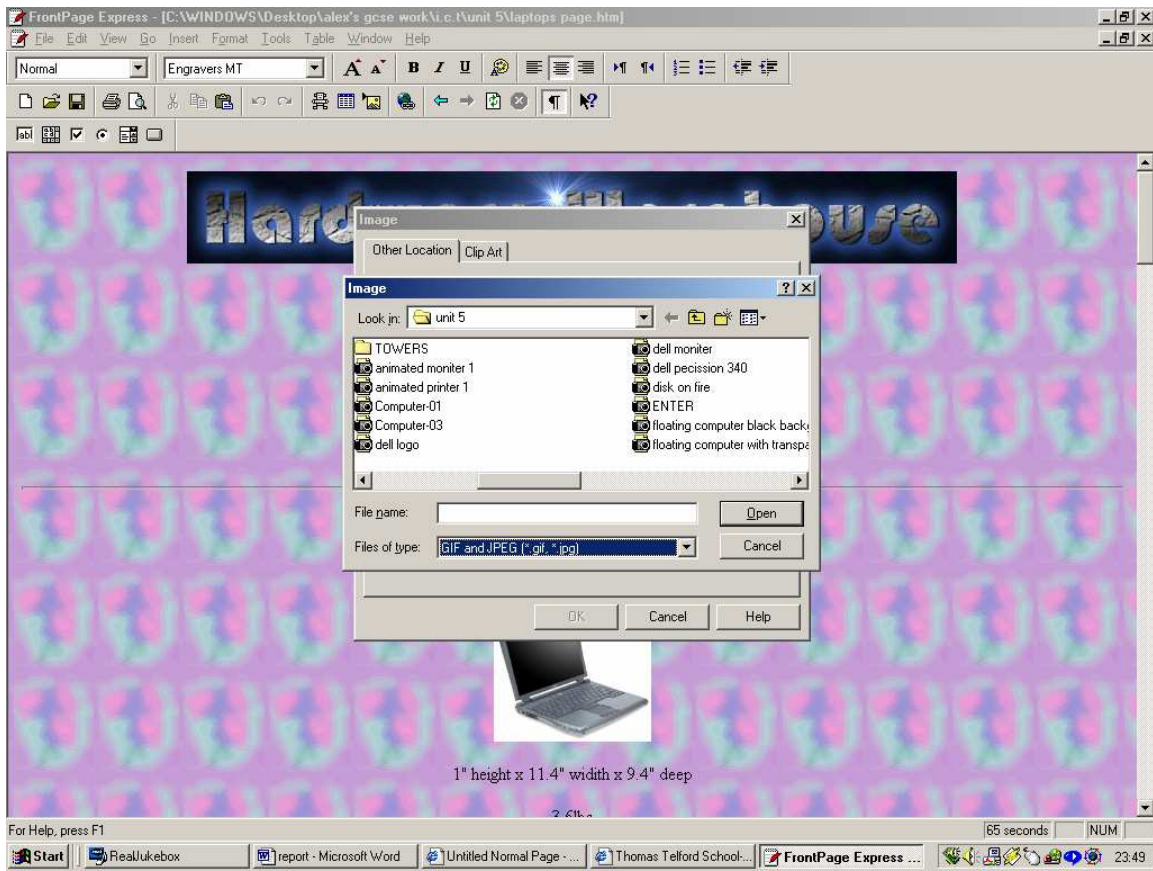

in order to create my web-page first of all I had to start by putting in background. I had decided to use on of the ones that I had downloaded from the bbc search results. for most of my web-page. In order to do this you right clicking your mouse button and a window will appear on this there will be four tabs. This include General Background Margins and custom. You then go onto the tab that says background this will then appear with the background menu. On this menu there will be a little box with the words BACKGROUND IMAGE written besides it you click on this and then you go to the browse tab. This will allow you to go threw your files searching for the background that you downloaded of the interenet.

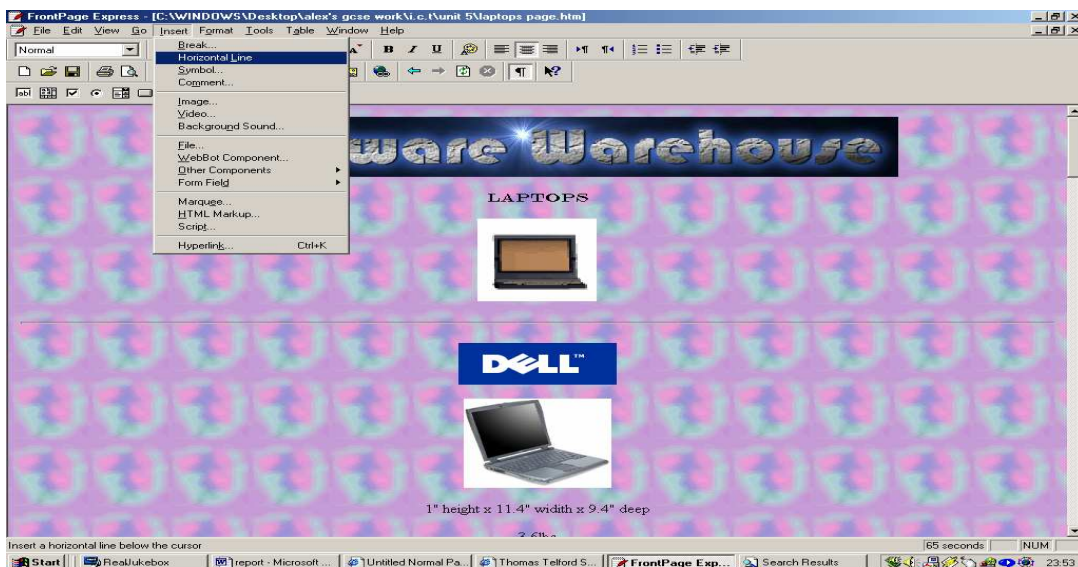

once I had decided on the background image that I wished to incorporate into my web-page it was time to add my animated text and images for my onto my background. In order to do this you go onto the main toolbar at the top of your page and you go onto the INSERT TAB and go down the scroll down menu which will then appear until you get to the tab image you then click with your left mouse button.

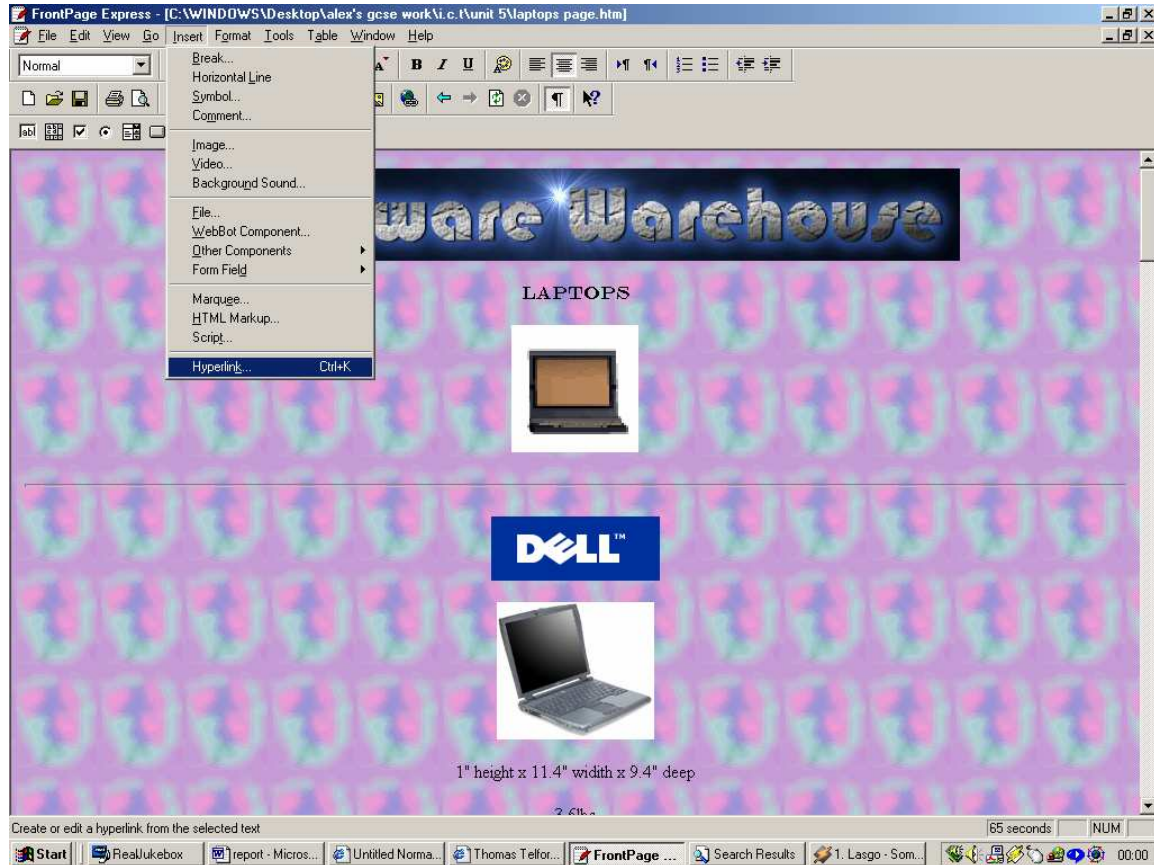

after you have done this a little window will appear this will then have the word BROWSE written on it you click on this tab and then another window will appear this is your file window you search threw your files until you get to the image that you wish to enter. When you selected the image that you wish to insert into your document then you click on the open tab.

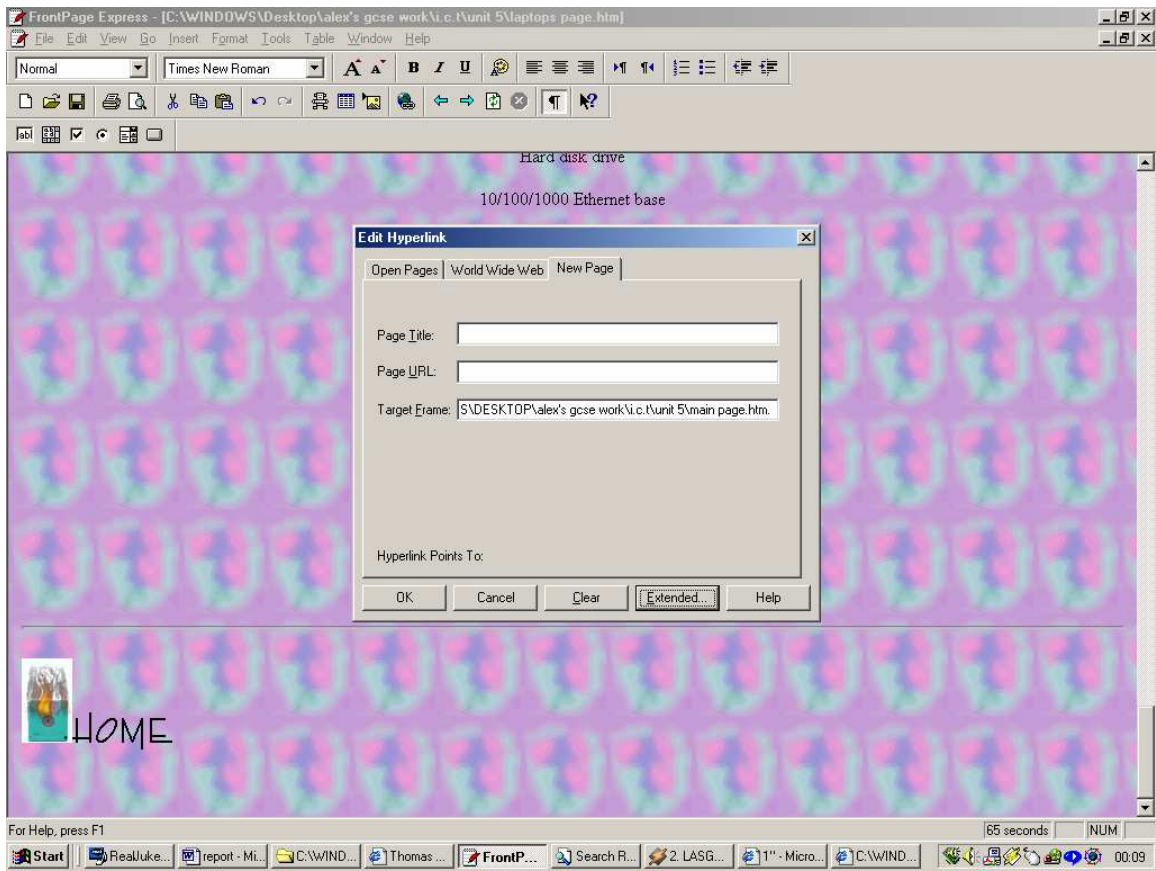

if you wish to separate a part of your web-page from one part to another you may wish to insert a horizontal line. In order to do this you go to select on your main toolbar menu and then onto insert then another scroll down menu will appear and you go onto horizontal line

after I had done this I added text to my web-page and made a hyperlink and linked my pages to other pages that I had designed. In order for me to do this I selected the insert button on the main tool bar and going to the bottom of the scroll down menu that appears and selecting HYPERLINK.

this then took me onto to another window which was called EDIT HYPERLINK and I then had to select the WORLD WIDE WEB button. This thwn comes up withits own tab and you have got insert the file or other that you are wishing to add the hyperlink between you then save the page and you then put a full stop onto the end of HTM and you have completed making a hyperlink.

in order to create a hyper link between an image and another it is done in the same way.
